The Screen Layout Manager

Warning: *The Screen Layout Manager only applies to* ADELIA *programs.*

This tool is used to create and modify the Adelia Studio transactions with all the flexibility and the ease of use of a graphical interface.

A screen design is created for each transaction defined at the SSG level.

The Screen layout manager is used to:

- generate a transaction, automatically, from a transaction template;
- define the characteristics of the transaction which have not been defined at the program level;
- define the formats used in the transaction;
- place on the layout the various fields required, define or modify these fields, and possibly duplicate the existing formats from other transactions;
- enter the technical documentation and the user documentation of the transaction.

Note: If a user does not have the required authorities on the program called, the Screen layout manager will be opened in display mode; the user will only be able to consult the various dialog boxes without making any modification. The **Modify** *button (used for validation) will become an* **Enter** *button.*

The Screen layout manager can also be opened for a **transaction template**. But in this case, it will not be possible to access some of the Screen layout manager options.
