The Visual Adelia Profiler

The Visual Adelia Profiler enables you to obtain logs of the execution of the Visual Adelia client/server applications.

It supports:

- Windows and Java client parts;

- Windows, AS/400 and Java server parts.

Useful information:

The server parts of a Visual batch program called from a server part are not logged.

If a window is executed non-modally, certain blocks may not be attached to the right window.

It is possible to log the Visual Adelia Batch, Interactive and Server programs.

> **note**: If an OutOfMemory (Exception) error occurs when programs are run in Java and in "log" mode, rerun with the switch.
>
> -Xmx512m, using the following command:
>
> > **Java -Xmx512m PGM_NAME**.
